This volume systematically details both the basic principles and new developments in Data Envelopment Analysis (DEA), offering a solid understanding of the methodology, its uses, and its potential. New material in this edition includes coverage of recent developments that have greatly extended the power and scope of DEA and have lead to new directions for research and DEA uses. Each chapter accompanies its developments with simple numerical examples and discussions of actual applications. The first nine chapters cover the basic principles of DEA, while the final seven chapters provide a more advanced treatment.

The 1939-45 war forced the Allied countries to seek alternative sources of raw materials and, as in the First World War, attention was paid by all belligerents to the marine algae or seaweeds. These occur in considerable quantities in various parts of the world, and attempts to make use of this cheap and readily accessible, though not so readily harvestable, raw material have been made almost from time immemorial. Much of the work on the economic utilization of seaweeds has been published only in scientific journals and has never been collected within the compass of a single book. Tressler's work on *The Marine Products of Commerce* contains three useful chapters on this subject, whilst Sauvageau's book, *Les utilisations des Algues Marines*, is a mine of valuable information, especially as regards the use of seaweeds in France. Both these volumes are, however,

somewhat out of date, Tressler's being published in 1923 and Sauvageau's in 1920. Furthermore there is no book wholly on this subject in the English language, and so the present volume has been undertaken in order to fill this gap. The opportunity has also been taken to incorporate the results of researches carried out since 1920. In certain aspects of the subject it will be found that considerable advances have been made, and in the present volume particular reference to such advances will be found in the chapters on agar and alginic acid.

This collection focuses on generations of early women historians, seeking to identify the intellectual milieu and professional realities that framed their lives. It moves beyond treating them as simply individuals and looks to the social and intellectual forces that encouraged them to study history and, at the same time, would often limit the reach and define the nature of their study. This collection of essays speaks to female practitioners of history over the past four centuries that published original histories, some within a university setting and some outside. By analysing the values these early women scholars faced, readers can understand the broader social values that led women historians to exist as a unit apart from the career path of their male colleagues.

An authorised reissue of the long out of print classic textbook, Advanced Calculus by the late Dr Lynn Loomis and Dr Shlomo Sternberg both of Harvard University has been a revered but hard to find textbook for the advanced calculus course for decades. This book is based on an honors course in advanced calculus that the authors gave in the 1960's. The foundational material, presented in the unstarred sections of Chapters 1 through 11, was normally covered, but different applications of this basic material were stressed from year to year, and the book therefore contains more material than was covered in any one year. It can accordingly be used (with omissions) as a text for a year's course in advanced calculus, or as a text for a three-semester introduction to analysis. The

prerequisites are a good grounding in the calculus of one variable from a mathematically rigorous point of view, together with some acquaintance with linear algebra. The reader should be familiar with limit and continuity type arguments and have a certain amount of mathematical sophistication. As possible introductory texts, we mention Differential and Integral Calculus by R Courant, Calculus by T Apostol, Calculus by M Spivak, and Pure Mathematics by G Hardy. The reader should also have some experience with partial derivatives. In overall plan the book divides roughly into a first half which develops the calculus (principally the differential calculus) in the setting of normed vector spaces, and a second half which deals with the calculus of differentiable manifolds.

History and magic intertwine in a fairytale retelling that will capture the hearts of Beauty and the Beast fans. Hope helps you endure. Love will break the spell. Paris, 1870. As the Franco-Prussian War enters its desperate final months, the capitol transforms from a splendid metropolis into a city under siege. Lavish meals change to rations, pigeons deliver letters, and two destinies will collide, challenged by a seemingly unbreakable curse. Every night, New York aristocrat Orin Rush transforms into a monster. After learning that a human heart is the only way to break the curse, he keeps himself carefully distant from anyone he might hurt. Can he lift the enchantment without taking a life? His search for answers leads him to Paris. Every day, free-spirited Claire Turin photographs the people and animals of Paris. Fascinated by the city she loves, her greatest dream is a secret she keeps in her apartment. Her greatest fear is the emptiness of night, when she thinks of the family she's lost. She's never loved anyone else. Maybe she never will. Will Paris and its people survive the hardship of the Siege? Will Orin break the curse? And will two hearts who've never known love awaken in the City of Light?
